PERIODONTICS & IMPLANT DENTISTRY

INFECTION CONTROL

Dentists and patients are concerned about the spread of infections. Our office shares this concern and that is why we have been pro-active in adopting the very latest in prevention techniques including:

WATERLINE DISINFECTION

Our office instituted a dental waterline disinfection program many years ago. We treat our waterlines with an antibacterial solution.

INSTRUMENT STERILIZATION

We use the most effective system to assure sterility of our instruments. We incorporated the HuFriedy "Instrument Management System (IMS) many years ago. As well, "hand pieces" are sterilized for each patient.

BARRIER TECHNIQUES

Of course we use disposable masks, and gloves that are changed for each patient. We also incorporate disposable barrier adhesive strips on all items we touch, which are also changed for each patient.

DISINFECTION WIPE-DOWN

We clean all surfaces with a special solution in-between each patient.

If you have any questions or concerns please do not hesitate to ask any of our staff about our office infection control procedures.
